TOXICOPATHOLOGIC EFFECTS OF AFLATOXIN B$_1$
AND MALARIAL INFECTION IN RAT LIVER

Abstract

The prevalence of aflatoxins are common in man in malaria endemic region such as in Africa and Southeast Asia. The interaction between the mycotoxin and the parasite were studied in animal as followed: A. weanling male and female Buffalo rats were divided into 3 groups: Group 1, $10^4$ P.berghei-treated; Group 2, DMSO followed by $10^4$ P.berghei-treated; and Group 3, AFB$_1$ (2 mg/kg body weight) followed by $10^4$ P.berghei-treated. B. Adult male Buffalo rats were divided into 4 group: Group 1, untreated; Group 2 $10^6$ P.berghei-treated; Group 3, AFB$_1$ (2 mg/kg body weight)-treated; and Group 4, AFB$_1$ (2 mg/kg body weight) followed $10^6$ P.berghei-treated.

When plasmodia were injected into 24 hr-AFB$_1$ treated animals. The different pattern of malarial disease
was observed in both weanling and adult animals. In weanling rats, instead of recovering as normally expected, they died in about three weeks after infection. The percents parasitemia were 60.4±9.2 and 56.4.9% while their mortality in male and female rats was 62.5 and 75% respectively. When AFB₁ was administered into male adult animal 24 hr before the plasmodium, similar results were noted but in lesser degree; i.e. the animal died on day 14 and 18 with 28.6% mortality and 24.0±6.3 per 10³ parasites instead of 12.6±1.3 per 10³ parasites. Of interest, it was that 6 adult animals in AFB₁/Malaria group developed precancerous lesion of hepatocellular carcinoma on days 17, 23 and 29, while only 1 animal with AFB₁ alone did on day 29.
Biography

Name: PERMSIN SATHIROPAS

Date of Birth: April 1, 1957

Place of Birth: Chumporn, Thailand

Institutions Attended:

Stree Chumporn School, Chumporn
March, 1973..... Certificate of M.S. III

Sri Ayudhya School, Bangkok
March, 1975..... Certificate of M.S.V

Faculty of Medical technology, Mahidol University, Bangkok
March, 1980..... Bachelor of Science in Medical technology
